

Product overview

Team Notes is a small, single-workspace application for an internal team to capture and retrieve short notes. The first release runs locally and is not exposed to the public internet.

Create a note

Users can create a note with a title and body. The title must contain 1 to 120 characters after trimming. The body must contain 1 to 5,000 characters after trimming. A successful create returns the saved note and its identifier.

Browse notes

Users can see all active notes ordered by most recently updated first. Each result shows its title and updated timestamp. When no active notes exist, the interface shows an empty state with a create action.

Read and edit

Users can open an active note and edit its title and body. Edits update the updated timestamp while preserving the creation timestamp. The same title and body limits apply to editing.

Archive

Users can archive a note. Archived notes disappear from the active list and search results. Looking up an archived note by its identifier returns the same 404 response as a missing note.

Search

Users can search active note titles and bodies without case sensitivity. Blank queries show the active note list. Product has not yet decided how a query containing multiple words should match.

Error contract

Invalid titles and bodies return HTTP 422 with a JSON errors array containing field and message. Missing or archived note identifiers return HTTP 404 with a JSON error message. The interface displays field errors next to their corresponding inputs.

Persistence

Use SQLite to persist notes, their archive state, and created and updated timestamps. Saved changes must remain available after the application restarts.

Interaction quality

The interface must support keyboard-only creation, browsing, editing, search and archiving. Show a saving state while changes are in progress and a recoverable error state if a request fails.

Excluded from release one

User accounts, authentication, public deployment, sharing links, real-time collaboration, attachments, rich-text editing, archive recovery and permanent deletion are out of scope for this release.
